C;Comment: Plasminogen is synthesized by the kidney and is present in plasma and many c
C;Comment: Plasminogen is converted into plasmin by plasminogen activators, both plasminediately after dissociation from the clot. In the presence of the inhibitor, the activation involves also removal of the activation peptide.
C;Comment: Stromelysin 1 (see PIR:KCMSS1) acts on plasminogen to produce angiostatin. 1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A, Accession: S03736
A, Molecule type: protein
A, Molecule type: protein
A, Molecule type: protein
C, Function:
C, Function:
C, Function: dissolves the fibrin of blood clots; acts as a proteolytic factor in a variate walls of the gradian follicle; also activates the urokinase-type plasminogen act
A, Description: dissolves the fibrinolysis
C, Superfamily: plasmin; kringle homology; plasminogen-related protein precursor homology
C, Superfamily: plasminogen #status predicted & GIG

The Courtain analysis of the genes encoding urokinase-type plasminogen
activator (uPA) and its inhibitor PAI-1 in advanced ovarian cancer.";
Electrophoresis Is 8:686-6891(1997).
THERAPY OF THROMBOLYTIC DISORDERS.
-!- CATALYTIC ACTIVITY: Specific cleavage of Arg-|-Val bond in
plasminogen to form plasmin.
-!- GATALYTIC ACTIVITY: Specific cleavage of Arg-|-Val bond in
plasminogen to form plasmin.
-!- SUBUNIT: FOUND IN HIGH AND LOW MOLECULAR MASS FORM CONTAINS A
LONG CHAINS, A AND B. THE HIGH MOLECULAR MASS FORM CONTAINS A
LONG CHAINS, A AND B. THE HIGH MOLECULAR MASS FORM TO YIELD A SHORT A1 CHAIN.
-!- PHARMACEUTICAL: Available under the name Abbokinase (Abbott). Used
IN PULIDARITY: BELONGS TO PEPTIDASE FAMILY S1.
-!- SIMILARITY: Contains I kringle domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This SWISS-PROT entry is copyright. SUBUNIT: FOUND IN HIGH AND LOW MOLECULAR MASS FORMS. BACH
CONSISTS OF TWO CHAINS, A AND B. THE HIGH MOLECULAR MASS FORM
CONTAINS A LONG CHAIN. A. CLEAVAGE OCCURS AFTER RESIDUE 156 IN THE
LOW MOLECULAR MASS FORM TO YIELD A SHORT AI CHAIN (BY SIMILARITY).
SIMILARITY: BELOWORS TO PEPTIPASE FAMILY SI.
SIMILARITY: Contains I Kringle domain.
                                                                                                                                                                                                                                                                                         ACTIVATOR

FTM: THE SINGLE CHAIN, ALMOST FULLY ACTIVE ENZYME, CAN BE FURTHER PROCESSED INTO A TWO-CHAIN FULLY ACTIVE FORM BY A CLEAVAGE AFTER ARG-308 CATALYZED BY FLASMIN, TISSUE KALLIKREIN OR FACTOR XA.

MISCELLANEOUS: BINDS TO THE KRINGLE STRUCTURE OF THE FIBRIN A SIMILARITY: BELONGS TO PEPTIDASE FAMILY SI.

SIMILARITY: COLLAINS I EGF-like domain.

SIMILARITY: Contains I EdF-like domain.

SIMILARITY: Contains 2 kringle domains.

Schleuning W.D., Bode W.;
"Catalytic domain structure of vampire bat plasminogen activator: a
molecular paradigm for proteolysis without activation cleavage.";
Biochemistry 36:13483-13493(1997).
-!- FUNCTION: PROBABLY ESERITIAL TO SUPPORT THE FEEDING HABITS OF THIS
EXCLUSIVELY HAEMATOPHAGOUS ANIMAL. POTENT THROMBOLYTIC AGENT.
-!- CATALYTIC ACTIVITY: Specific cleavage of Arg-|-Val bond in
plasminogen to form plasmin.
-!- ENZYME REGULATION: ACTIVITY TOWARD PLASMINOGEN IS STIMULATED IN
THE PRESENCE OF FIBRIN I.
                                                                                                                                          Donner P.; "Plasminogen activators from the saliva of Desmodus rotundus (common vampire bat): unique fibrin specificity."; Ann. N.Y. Acad. Sci. 667:395-403(1992).

"Generation and initial analysis of more than 15,000 full-length human and mouse cDNA sequences."

Proc. Natl. Acad. Sci. U.S., 99:16899-16903(2002).

-!- FUNCTION: CONVERTS THE ABUNDANT, BUT INACTIVE, ZYMOGEN PLASMINOGEN TO PLASMIN BY HYDROLYZING A SINGLE RRG-VAL BOND IN PLASMINOGEN. BY CONTROLLING PLASMIN-MEDIATED PROTECLYSIS, IT PLAYS AN IMPORTANT ROLE IN TISSUE REMODELING AND DEGRADATION, IN CELL MIGRATION AND MANY OTHER PHYSIOPATHOLOGICAL EVENTS.

-!- CATALYTIC ACTIVITY: Specific cleavage of Arg-|-val bond in plasminogen to form plasmin.

-!- SUBUNIT: HETERODIMER OF CHAIN A AND CHAIN B HELD BY A DISULFIDE
                                                                                                                                                                                                                      SUBCELLULAR LOCATION: SECRETED; EXTRACELLULAR.

PTM: THE SINGLE CHAIN, ALMOST FULLY ACTIVE ENZYME, CAN BE FURTHER PROCESSED INTO A TWO-CHAIN FULLY ACTIVE FORM BY A CLEAVAGE AFTER ARG-308 CATHLYZED BY PLASMIN, TISSUE KALLIKREIN OR FACTOR XA.

MISCELLANEOUS: BINDS TO THE KRINGLE STRUCTURE OF THE FIBRIN A CHAIN. BINDING TO FIBRIN ENHANCES ITS CATALYTIC ACTIVITY.

SIMILARITY: BELONGS TO PEPTIDASE FAMILY SI.

SIMILARITY: Contains I EGF-like domain.

SIMILARITY: Contains I fibronectin type I domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           EMBL; BC011256; AA411256.1; -.

                                                                                                                                                                                                                                                                                                                                                             DAILY J. 5:605-617(1995).

FUNCTION: CONVERTS THE ABUNDANT, BUT INACTIVE, ZYMOGEN PLASMINOGEN
TO PLASMIN BY HYDROLYZING A SINGLE ARG-VAL BOND IN PLASMINOGEN. BY
CONTROLLING PLASMIN-MEDIATED RROTEOLYSIS, IT PLAYS AN IMPORTANT
ROLE IN TISSUE REMODELING AND DEGRADATION, IN CELL MIGRATION AND
MANY OTHER PHYSIOPATHOLOGICAL EVENTS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SUBCELLULAR LOCATION: SECRETED; EXTRACELLULAR.

PTM: THE SINGLE CHAIN, ALMOST FULLY ACTIVE ENZYME, CAN BE FURTHER PROCESSED INTO A TWO-CHAIN FULLY ACTIVE FORM BY A CLEAPARGE AFTER ARG-314 CATALYZED BY PLASMIN, TISSUE KALLIKREIN OR FACTOR XA.
MISCELLANEOUS: BINDS TO THE KRINGLE STRUCTURE OF THE FIBRIN A CHAIN. BINDING TO FIBRIN ENHANCES ITS CATALYTIC ACTIVITY.
SIMILARITY: COLLAINS I EGF-like domain.
SIMILARITY: Contains I EGF-like domain.
SIMILARITY: Contains 2 kringle domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CATALYTIC ACTIVITY: Specific cleavage of Arg-|-Val bond in plasminogen to form plasmin. SUBUNIT: HETERODIMER OF CHAIN A AND CHAIN B HELD BY A DISULFIDE
                                                                                                                                                            Bukaryota; Merazoa; Chordata; Craniata; Vertebrata; Buteleostomi;

Zhao S., Odell C.;
Submitted (FRE-1996) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: ACTIVATES HEPATOCYTE GROWTH FACTOR (HGF) BY
CONVERTING IT PROM A SINGLE CHAIN TO A HETERODIMERIC FORM.
-!- SUBUNIT: DIMER OF A SHORT CHAIN AND A LONG CHAIN LINKED BY A
                                                                                                                                                                                                                                 -!- SUBCELLULAR LOCATION: SECRETED AS AN INACTIVE SINGLE-CHAIN PRECURSOR AND IS THEN ACTIVATED TO A HETERODIMERIC FORM.
-!- TISSUE SPECIFICITY: LIVER.
-!- SIMILARITY: BELONGS TO PEPTIDASE FAMILY SI.
-!- SIMILARITY: Contains 2 EGF-like domains.
-!- SIMILARITY: Contains 1 fibronectin type I domain.
-!- SIMILARITY: Contains 1 fibronectin type II domain.
-!- SIMILARITY: Contains 1 fibronectin type II domain.
-!- SIMILARITY: Contains 1 kindle domain.
-!- SIMILARITY: Contains 1 kindle domain.

```

```
THE INITIATION FACTOR XII IS A SERUM GLYCOPROTEIN THAT PARTICIPATES IN THE INITIATION OF BLOOD COAGULATION, FIBRINOLYSIS, AND THE GENERATION OF BLOOD COAGULATION, FIBRINOLYSIS, AND THE GENERATION OF BRADYKININ AND ANGOTENEN; AND THE DENERATION OF BRADYKININ AND ANGOTENENS.

-!- CATALYTIC ACTIVITY: Cleaves selectively Arg-|-Ile bonds in factor VII to form factor VIIa and factor XI to form factor XIa.

-!- AND N-GLYCOSYLATED.

-!- DISEASE: DEFECTS IN F12 DO NOT CAUSE ANY CLINICAL SYMPTOMS. THE SOLE EFFECT IS THAT WHOLE-BLOOD CLOTTING TIME IS PROLONGED.

-!- MISCELLENBOUS: FACTOR XII, PRERALLIKREIN, AND HWW KININOGEN FORM A COMPLEX BOUND TO AN ANIONIC SURFACE. PREFALLIKREIN IS CLEAVED BY FACTOR XII TO FORM KALLIKREIN, WHICH THEN CLEAVES FACTOR XII FIRST XIIA ACTIVATES FACTOR XII TO FACTOR XIA.

-!- SIMILARITY: Contains 1 fibronectin type I domain.

-!- SIMILARITY: Contains 1 fibronectin type II domain.

-!- SIMILARITY: Contains 1 kringle domain.
                                                                                                                                                                                                                                                                                                                                                                                                                               This SWISS-PROT entry is copyright.
